Saransh Sahu | Motion, Web & Performance

I'm Saransh Sahu, an engineer in Bengaluru. I work on the parts of a digital experience people notice: whether a story holds their attention, a checkout remembers their choices, or a busy service makes them wait.

AI video generation

From a brief to a shot list, with character references, camera direction, dialogue timing and an edit plan.

Concept study · Ten Tiny Canvases

0–3s: A brush draws a cherry-red line across one nail tip. 3–7s: Match cut to the same line running through a complete set. 7–12s: A hand turns in window light; the polish catches the light before the title appears.

Pre-production sample · storyboard, not a finished reel

Website correction & expansion

I trace the customer journey, fix the point where it breaks, and carry new features through the interface, API and order record.

Build · Artelier custom press-ons

Artelier began as an art shop. I adapted its checkout so a custom nail set requires ten confirmed widths. The studio receives those widths with the order. Buyers shop; artists apply separately and can manage only their own listings.

Delivered · sizing guide, checkout validation and seller roles

Latency diagnosis & correction

I separate time spent at the API, database and queue, then compare the same workload before and after a change.

Engineering example · payment testing

In a non-production launch test, throughput rose from 38 to 75 orders per minute after database optimisation. Some payment calls remained slow. That distinction matters: higher throughput does not prove lower p95 latency.

Reported test result · throughput, not a production latency benchmark
